

## User-Driven Innovations

	<p>a. PCT Touch Screen (optional) In addition to the standard 5-wire resistive touch panel, Logic Controls brings in the option of Projected Capacitive Touch (PCT) screen. This newly developed technology not only permits more accurate operation, but also eliminates the calibrating process. Even with an extra coated protection layer, the operation could still perform precisely without direct contact.</p>
	<p>b. Multi-touch function The multi-touch function creates the true accessory-free scenario for the POS system operators by eliminating external keyboard, mouse, and etc. This user friendly design presents a next level of accessibility and usability to every All-in-One system.</p>
	<p>c. Adjustable base and customer display Customers can manage a customized viewing angle that best fits to the operating environment. These features would help Logic Controls' users to adjust the touch screen and the customer display based on the structural design of their front counters.</p>
	<p>d. Simple hardware connectivity Logic Controls SB-9090 comes with a detachable connector cover. Unlike the traditional design, this slide-in/out cover creates easy hardware integration for users or system integrators when the external peripheral is used.</p>
	<p>e. Exchangeable HDD With no hassle, users can exchange the hard drive by removing the attached screws. This design allows business owners and operators to perform basic system maintenance. Further, the use of an isolated compartment keeps the hard drive away from the main heat source generated by the mother board.</p>
